

PRESS NOTE

TELECOM ITALIA: FIBRE OPTIC TO HOMES IN 35 MUNICIPALITIES OF LOMBARDY

The initiative is part of the new national cabling plan in FTTH (Fibre To The Home) technology, communicated to the Ministry of Economic Development, which plans to cover 100 cities by March 2018

This action is in addition to the national development plan, which already sees Telecom Italia committed in the realization of the NGAN (Next Generation Access Network) in FTTCab (Fibre to the Cabinet) technology, with the goal of reaching 75% of the population by 2017

Bergamo, Brescia, Como, Monza, Pavia and Varese, in addition to Milan already covered previously, are among the main cities of Lombardy involved in the initiative

Milan, 09 July 2015

Telecom Italia accelerates with ultra-broadband in Lombardy and brings fibre optic to homes in 35 municipalities of the region, allowing super-fast connections from 100 Megabits per second (and potentially up to 1 Giga) that guarantee even higher quality in the use of HD video content and a better browsing experience. The initiative is part of the new national cabling plan in FTTH (Fibre To The Home) technology, communicated to the Ministry of Economic Development through Infratel, which plans to reach 100 cities by March 2018.

With the adoption of the new infrastructure development program of the fibre optic network in the country using the FTTH network architecture, with which the laying of the fibre goes beyond road cabinets directly reaching homes and offices, Telecom Italia aims to give further impetus to the country's digitization processes and facilitate the achievement of the objectives set by the Digital Agenda. This action is thus in addition to the national development plan, which already sees Telecom Italia committed in the realization of the NGAN (Next Generation Access Network) in FTTCab (Fibre to the Cabinet) technology, with the goal of reaching 75% of the population by 2017

Existing infrastructure will be used to lay the fibre optic cables and, in case of excavations, innovative low environmental impact equipment and techniques will be used that reduce work time, work site area, ground broken, material removed, paving impairment and consequently road repairs to a minimum.

By creating increasingly advanced ultrabroadband infrastructure, Telecom Italia has confirmed its commitment to innovating at local level and disseminating the services enabled by these solutions, thus contributing to the sustainable growth of the local economy and to improving quality of life for citizens.
